What I cut and why · assumptions · questions for the partner · Martin Ignatov · 25 Sep 2026

What I cut or changed, and why

Cut order if week 3 shows risk: the optional preview of what would've fired, thumbs-up/down feedback, the "building" progress indicator, in-chart pop-ups (falling back to the standard alert pop-up), then shareable preset codes. The week-1 temporary fix means the cohort starts with a working setup regardless.

The partner's "they don't alert me" claim doesn't hold up: Bookmap's own indicator already alerts (sound, Telegram). The real gap is setup friction and false alarms.

Asked for	Decision	Why
A feature "called out as my method"	Generic Hold-Check mode; the partner's presets ship bundled as "«Partner» ES" / "«Partner» CL", credited ("by «Partner» ✓")	Standard vocabulary, useful to all users. A named feature implies endorsing a method and alienates other educators.
A new indicator	Upgrade the existing Absorption indicator behind a flag (Classic unchanged); fallback: a separate add-on	Avoids two "absorption" products with different definitions
Alert when the volume is hit	Alert after a 3–5 s confirm window with evidence of refill; a reclaimed 1-tick poke is tolerated	Otherwise it fires at the start of breakouts
"Highest-probability reversal"	Report the outcome (Held/Broken); no probability ranking	Can't be validated; compliance risk
MBO detection	Aggregated data for all; MBO confidence in Phase 2	Most students lack MBO; the heatmap is aggregated
Platform: desktop or web	Web	Confirmed with Head of Product
Push, one-click Telegram, e-mail	Phase 2	Needs server-side detection and a licensing review
Adaptive thresholds; presets beyond ES/CL	Phase 2. Now: fixed ES/CL presets + alert hours	Testable; matches "tuned for ES and CL"

Assumptions

Confirmed:

- Platform: focus on Bookmap Web platform.
- Scope: address the influencer's request but thought a generic solution rather than custom-tailored only to her requirements.

Assumed, flagged to confirm:

- Market Pulse Web's algorithm-hosting framework can host Absorption Hold-Check
- Web gates this the same way desktop does (Global+) and has ES/CL data available
- A web deploy reaches every cohort member instantly once turned on
- No market data leaves the platform in the MVP; Global+ with a partner trial code.

Questions I would have asked the partner

- Q0. When you miss one, weren't you looking, or couldn't you tell it would hold?
- Q1. Are you and your students using the same platform, data feed, and subscription package? Assumed she trades on desktop herself, but the students are on web; students mostly without MBO.
- Q2. Which indicators did you try, including Bookmap's Absorption, and what failed?
- Q3. Can you label at least 5 past examples per instrument, including misses and look-alikes?
- Q4. What makes an order "big"; how much volume in how long? On CL, one tick or a few?
- Q5. May the price poke a tick through and come back?
- Q6. Alert the moment heavy volume is absorbed (a few seconds after the threshold, so you can judge the reaction yourself), or only once the level has held and price has moved away? What penetration, holding time and move-away distance count as "held" for ES and CL?
- Q7. Where must the ping reach you: desktop, phone and via what channel?
- Q8. What time zone and hours count as your "morning session" for ES and for CL?
- Q9. How exactly do you want your method to be called?
- Q10. Will you supply the exact volume/timing/distance numbers for your ES and CL templates yourself, or should we propose calibrated starting values for you to approve?
